

# **CS 228 : Logic in Computer Science**

Krishna. S

## Some Real Life Stories

# Therac-25(1987)

---

- ▶ The Therac-25 : radiation therapy machine produced by Atomic Energy of Canada Limited (AECL)

# Therac-25(1987)

---

- ▶ The Therac-25 : radiation therapy machine produced by Atomic Energy of Canada Limited (AECL)
- ▶ Involved in **at least six accidents**, in which patients were given massive overdoses of radiation, **approximately 100 times** the intended dose.

# Therac-25(1987)

---

- ▶ The Therac-25 : radiation therapy machine produced by Atomic Energy of Canada Limited (AECL)
- ▶ Involved in **at least six accidents**, in which patients were given massive overdoses of radiation, **approximately 100 times** the intended dose.
- ▶ Design error in the control software (race condition)

# Intel Pentium Bug (1994)

---

- ▶ The Intel FDIV bug : Bug in the intel P5 floating point unit

# Intel Pentium Bug (1994)

---

- ▶ The Intel FDIV bug : Bug in the intel P5 floating point unit
- ▶ Discovered by a professor working on Brun's constant
- ▶  $(\frac{1}{3} + \frac{1}{5}) + (\frac{1}{5} + \frac{1}{7}) + (\frac{1}{11} + \frac{1}{13}) + (\frac{1}{17} + \frac{1}{19}) + \dots$  converges to  $B \cong 1.90216054$

# Intel Pentium Bug (1994)

---

- ▶ The Intel FDIV bug : Bug in the intel P5 floating point unit
- ▶ Discovered by a professor working on Brun's constant
- ▶  $(\frac{1}{3} + \frac{1}{5}) + (\frac{1}{5} + \frac{1}{7}) + (\frac{1}{11} + \frac{1}{13}) + (\frac{1}{17} + \frac{1}{19}) + \dots$  converges to  $B \cong 1.90216054$
- ▶ Intel offered to replace all flawed processors

# Ariane 5 (1996)

---

- ▶ ESA (European Space Agency) Ariane 5 Launcher

# Ariane 5 (1996)

---

- ▶ ESA (European Space Agency) **Ariane 5 Launcher**
  - ▶ Shown here in maiden flight on 4th June 1996

# Ariane 5 (1996)

---

- ▶ ESA (European Space Agency) **Ariane 5 Launcher**
  - ▶ Shown here in maiden flight on 4th June 1996
- ▶ Self destructs 37 secs later

# Ariane 5 (1996)

---

- ▶ ESA (European Space Agency) **Ariane 5 Launcher**
  - ▶ Shown here in maiden flight on 4th June 1996
- ▶ Self destructs 37 secs later
  - ▶ **uncaught exception: data conversion from 64-bit float to 16-bit signed int**

# Toyota Prius (2010)

---

- First mass produced hybrid vehicle

# Toyota Prius (2010)

---

- ▶ First mass produced hybrid vehicle
  - ▶ software “glitch” found in anti-lock braking system
  - ▶ Eventually fixed via software update in total 185,000 cars recalled, at huge cost

# Nest Thermostat (2016)

---

- ▶ Nest Thermostat, the smart, learning thermostat from Nest Labs

# Nest Thermostat (2016)

---

- ▶ Nest Thermostat, the smart, learning thermostat from Nest Labs
  - ▶ **software “glitch”** led several homes to a frozen state, reported in NY times, Jan 13, 2016. May be, old fashioned mechanical thermostats better!

# What do these stories have in common?

---

- ▶ Programmable computing devices
  - ▶ conventional computers and networks
  - ▶ software embedded in devices

# What do these stories have in common?

---

- ▶ Programmable computing devices
  - ▶ conventional computers and networks
  - ▶ software embedded in devices
- ▶ Programming error direct cause of failure
- ▶ Software critical
  - ▶ for safety
  - ▶ for business
  - ▶ for performance

# What do these stories have in common?

---

- ▶ Programmable computing devices
  - ▶ conventional computers and networks
  - ▶ software embedded in devices
- ▶ Programming error direct cause of failure
- ▶ Software critical
  - ▶ for safety
  - ▶ for business
  - ▶ for performance
- ▶ High costs incurred: financial, loss of life
- ▶ Failures avoidable

# Formal Methods

---

## Intuitive Description

“Applied Mathematics for modelling and analysing ICT systems”

Formal methods offer a large potential for:

# Formal Methods

---

## Intuitive Description

“Applied Mathematics for modelling and analysing ICT systems”

Formal methods offer a large potential for:

- ▶ obtaining an **early integration** of verification in the design process

# Formal Methods

---

## Intuitive Description

“Applied Mathematics for modelling and analysing ICT systems”

Formal methods offer a large potential for:

- ▶ obtaining an **early integration** of verification in the design process
- ▶ providing **more effective** verification techniques (higher coverage)

# Formal Methods

---

## Intuitive Description

“Applied Mathematics for modelling and analysing ICT systems”

Formal methods offer a large potential for:

- ▶ obtaining an **early integration** of verification in the design process
- ▶ providing **more effective** verification techniques (higher coverage)
- ▶ **reducing** the verification time

# Simulation and Testing

---

## Basic procedure

- ▶ Take a model
- ▶ Simulate it with certain inputs
- ▶ Observe what happens, and if this is desired

## Important Drawbacks

- ▶ possible behaviours very large/infinite
- ▶ unexplored behaviours may contain fatal bug
- ▶ can show presence of errors, **not** their absence

# Model Checking

---

- ▶ Year 2008 : ACM confers the **Turing Award** to the pioneers of Model Checking: **Ed Clarke, Allen Emerson, and Joseph Sifakis**
- ▶ Why?

# Model checking

---

- ▶ Model checking has evolved in last 25 years into a widely used verification and debugging technique for software and hardware.
- ▶ Cost of *not* doing formal verification is high!
  - ▶ The France Telecom example
  - ▶ Ariane rocket: kaboom due to integer overflow!
  - ▶ Toyota/Ford recalls

# Model checking

---

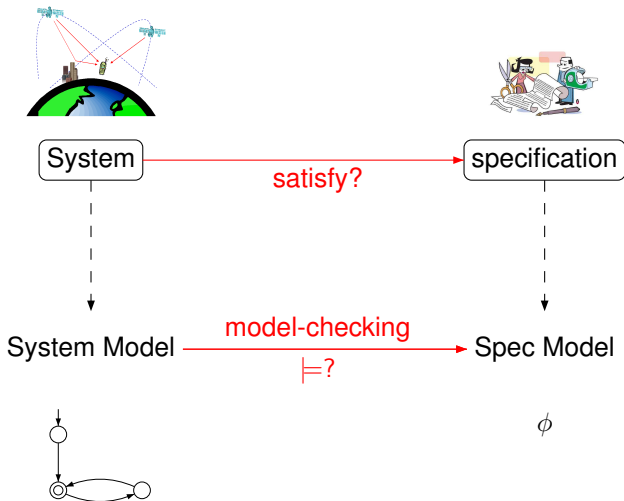

- ▶ Model checking has evolved in last 25 years into a widely used verification and debugging technique for software and hardware.
- ▶ Cost of *not* doing formal verification is high!
  - ▶ The France Telecom example
  - ▶ Ariane rocket: kaboom due to integer overflow!
  - ▶ Toyota/Ford recalls
- ▶ Model checking used (and further developed) by companies/institutes such as IBM, Intel, NASA, Cadence, Microsoft, and Siemens, and has culminated in many freely downloadable software tools that allow automated verification.

# What is Model Checking?

---

# What is Model Checking?

# Model Checker as a Black Box

---

- ▶ Inputs to Model checker : A finite state system  $M$ , and a property  $P$  to be checked.
- ▶ Question : Does  $M$  satisfy  $P$ ?
- ▶ Possible Outputs
  - ▶ Yes,  $M$  satisfies  $P$
  - ▶ No, here is a counter example!.

# What are Models?

---

## Transition Systems

- ▶ States labeled with propositions
- ▶ Transition relation between states
- ▶ Action-labeled transitions to facilitate composition

# What are Models?

---

## Transition Systems

- ▶ States labeled with propositions
- ▶ Transition relation between states
- ▶ Action-labeled transitions to facilitate composition

## Expressivity

- ▶ Programs are transition systems
- ▶ Multi-threading programs are transition systems
- ▶ Communicating processes are transition systems
- ▶ Hardware circuits are transition systems
- ▶ What else?

# What are Properties?

---

## Example properties

- ▶ Can the system reach a deadlock?
- ▶ Can two processes ever be together in a critical section?
- ▶ On termination, does a program provide correct output?

# What are Properties?

---

## Example properties

- ▶ Can the system reach a deadlock?
- ▶ Can two processes ever be together in a critical section?
- ▶ On termination, does a program provide correct output?

## Logics of Relevance

- ▶ Classical Logics
  - ▶ First Order Logic
  - ▶ Monadic Second Order Logic
- ▶ Temporal Logics
  - ▶ Propositional Logic, enriched with modal operators such as  $\Box$  (always) and  $\Diamond$  (eventually)
  - ▶ Interpreted over state sequences (linear)
  - ▶ Or over infinite trees (branching)

# Two Traffic Lights

---

1. The traffic lights are never green simultaneously  
 $\forall x (\neg(\text{green}_1(x) \wedge \text{green}_2(x)))$  or  $\Box(\neg(\text{green}_1 \wedge \text{green}_2))$
2. The first traffic light is infinitely often green  
 $\forall x \exists y (x < y \wedge \text{green}_1(y))$  or  $\Box \Diamond \text{green}_1$
3. Between every two occurrences of traffic light 1 becoming red, traffic light 2 becomes red once.

# The Model Checking Process

---

- ▶ **Modeling Phase**
  - ▶ model the system under consideration
  - ▶ as a first sanity check, perform some simulations
  - ▶ formalise property to be checked

# The Model Checking Process

---

- ▶ **Modeling Phase**

- ▶ model the system under consideration
- ▶ as a first sanity check, perform some simulations
- ▶ formalise property to be checked

- ▶ **Running Phase**

- ▶ run the model checker to check the validity of the property in the model

# The Model Checking Process

---

- ▶ **Modeling Phase**

- ▶ model the system under consideration
- ▶ as a first sanity check, perform some simulations
- ▶ formalise property to be checked

- ▶ **Running Phase**

- ▶ run the model checker to check the validity of the property in the model

- ▶ **Analysis Phase**

- ▶ property satisfied? → check next property (if any)
- ▶ property violated? →
  - ▶ analyse generated counter example by simulation
  - ▶ refine the model, design, property, . . . and repeat entire procedure
- ▶ out of memory? → try to reduce the model and try again

# The Pros of Model Checking

---

- ▶ widely applicable (hardware, software...)
- ▶ allows for partial verification (only relevant properties)
- ▶ potential “push-button” technology (tools)
- ▶ rapidly increasing industrial interest
- ▶ in case of property violation, a counter example is provided
- ▶ sound mathematical foundations
- ▶ not biased to the most possible scenarios (like testing)

# The Cons of Model Checking

---

- ▶ model checking is only as “good” as the system model
- ▶ no guarantee about **completeness** of results (incomplete specifications)

Nevertheless:

**Model Checking is an effective technique to expose potential design errors**

# Striking Model-Checking Examples

---

- ▶ **Security : Needham-Schroeder encryption protocol**
  - ▶ error that remained undiscovered for 17 years revealed (model checker SAL)
- ▶ **Transportation Systems**
  - ▶ Train model containing  $10^{47}$  states (model checker UPPAAL)
- ▶ **Model Checkers for C, JAVA, C++**
  - ▶ used (and developed) by Microsoft, Intel, NASA
  - ▶ successful application area: device drivers (model checker SLAM)
- ▶ **Dutch storm surge barrier in Nieuwe Waterweg**
- ▶ **Software in current/next generation of space missiles**
  - ▶ NASA's
    - ▶ Java Pathfinder, Deep Space Habitat, Lab for Reliable Software

# Relevant Topics

---

- ▶ What are appropriate **models**?
  - ▶ from programs, circuits, communication protocols to transition systems

# Relevant Topics

---

- ▶ What are appropriate **models**?
  - ▶ from programs, circuits, communication protocols to transition systems
- ▶ What are properties?
  - ▶ Safety, Liveness, fairness

# Relevant Topics

---

- ▶ What are appropriate **models**?
  - ▶ from programs, circuits, communication protocols to transition systems
- ▶ What are properties?
  - ▶ Safety, Liveness, fairness
- ▶ How to check **regular** properties?
  - ▶ finite state automata and regular safety properties
  - ▶ Buchi automata and  $\omega$ -regular properties

# Relevant Topics

---

- ▶ How to express properties **succintly**?
  - ▶ First Order Logic (FO) : syntax, semantics
  - ▶ Monadic Second Order Logic (MSO) : syntax, semantics
  - ▶ Linear-Temporal-Logic (LTL) : syntax, semantics
  - ▶ What can be expressed in each logic?
  - ▶ Satisfiability and Model checking : algorithms, complexity
